

## European BMS lithium battery project

The EU-supported NEXTBMS project is dedicated to creating an advanced battery management system that guarantees safety, prolonged lifespan, and increased efficiency, all of which are essential for a sustainable transportation industry. This tracker monitors the Horizon Europe's financial contribution to both mitigating climate change (e.g., contributions to the reduction of greenhouse gas emissions) and adapting to climate change by building resilience (e.g., regarding floods, droughts, spatial planning and better governance). Developing the next generation BMSs enabling higher performance, safety and longer lifetime of the battery cells for an overall optimal utilization of the battery system. NEXTBMS will develop next-generation physics and data-based Battery Management Systems for optimized battery utilization. Facilitating grid flexibility through energy storage is crucial for accommodating higher levels of renewable penetration, ushering in a more electrified and decarbonised society through the repurposing of second-life batteries. ENERGETIC project aims to develop the next generation BMS for In this context, the ERC-funded INTERACT project will use atom probe tomography and novel cryogenic techniques to decode the mysteries of solid electrolyte interphases and pave the way for advanced battery technologies. Battery technology plays a crucial role in electrical machinery, vehicles, and Fraunhofer ITWM is working with 16 European partners in the EU project 'Stellar' to develop a cost-effective test facility for the safe and sustainable production of lithium metal (LiM) battery anode foils. Launched in June and scheduled to run for four years, the project aims to develop a Developing a cutting-edge dynamically responsive battery management system, leading to maximized battery performance without loss in lifetime. InnoBMS is a 3,5-year project, aiming to develop a dynamically responsive battery management system, resulting in maximum battery performance without a NEXT-generation physics and data-based Battery Management The EU-supported NEXTBMS project is dedicated to creating an advanced battery management system that guarantees safety, prolonged lifespan, and increased efficiency, all NEXTBMS | Advanced physics and data-based NEXTBMS will build on fundamental knowledge and experience with physiochemical processes of lithium-ion batteries to significantly enhance current modelling approaches and achieve optimal utilization of the Homepage BATTERY2LIFE will bring together, adapt, and improve technological advances in Battery Management Systems (BMS) and system design, as well as diagnostics for the efficient HOME Safer, Smarter Batteries through Advanced BMS and AI ENERGETIC project aims to develop the next generation BMS for optimizing batteries' systems utilization in the first (transport) and the EU-Funded Projects - Batteries Europe Addressing this issue, the EU-funded BIG LEAP project aims to develop solutions for SLBs' BMS and its reconfiguration process. The project will introduce a new three-layer BMS architecture European project Stellar develops anode production for lithium Fraunhofer ITWM is working with 16 European partners in the EU project 'Stellar' to develop a cost-effective test facility for the safe and sustainable production of lithium metal Situationally aware innovative battery management system for InnoBMS is a 3,5-year project, aiming to develop a dynamically responsive battery management system, resulting in maximum battery

## European BMS lithium battery project

performance without a negative result in battery lifetime. NEXTBMS: Advanced battery management system for optimised The European research project NEXTBMS (long title: NEXT-generation physics and data-based Battery Management Systems for optimized battery utilization) aims to develop an Fraunhofer ITWM and European Partners Launch EUR7.9 Million Fraunhofer ITWM has joined 16 European partners in a new EU-funded project called "Stellar", which seeks to develop a cost-effective and sustainable roll-to-roll test facility Project NEXTBMS will contribute to this by developing in the next 3,5 years an advanced battery management systems (BMS) built on fundamental knowledge and experience with the physicochemical processes of lithium NEXT-generation physics and data-based Battery Management The EU-supported NEXTBMS project is dedicated to creating an advanced battery management system that guarantees safety, prolonged lifespan, and increased efficiency, all NEXTBMS | Advanced physics and data-based BMS for optimal battery NEXTBMS will build on fundamental knowledge and experience with physiochemical processes of lithium-ion batteries to significantly enhance current modelling approaches and achieve NEXTBMS: Advanced battery management system for optimised battery The European research project NEXTBMS (long title: NEXT-generation physics and data-based Battery Management Systems for optimized battery utilization) aims to develop an Project NEXTBMS will contribute to this by developing in the next 3,5 years an advanced battery management systems (BMS) built on fundamental knowledge and experience with the NEXT-generation physics and data-based Battery Management The EU-supported NEXTBMS project is dedicated to creating an advanced battery management system that guarantees safety, prolonged lifespan, and increased efficiency, all Project NEXTBMS will contribute to this by developing in the next 3,5 years an advanced battery management systems (BMS) built on fundamental knowledge and experience with the
