Is a solar inverter a converter? A solar inverter is really a converter, though the rules of physics say otherwise. A solar power inverter converts or inverts the direct current (DC) energy produced by a solar panel into Alternate Current (AC.) Most homes use AC rather than DC energy. DC energy is not safe to use in homes. Can I add solar panels later with a microinverter? While it's easier to add solar panels to your system later with microinverters, choosing the right string inverter before your installation is critical, as central inverter systems are typically built-to-suit without the capacity for expanded solar generation. Use our online tool to find the right sizes for your solar energy system components. Which solar inverter is suitable for a home solar system? A stand-alone solar inverter is also suitable for a home solar system if you are planning to go completely off-grid. These inverters are free from grid connection and thus do not require anti-islanding protection. Such inverters are usually backed with solar batteries. Why are solar inverters important? When people think about a solar energy system, solar panels are usually one of the first things that come to mind. While solar panels are undeniably important, solar inverters are an equally crucial system component--especially when it comes to creating sustainable energy solutions in homes and buildings around the world. What type of solar inverter makes the most sense? Those are the kinds of things that can make a real difference in what type of inverter solution makes the most sense," Kurchin added. When it comes to home solar installation, homeowners have three types of solar inverters to consider: string inverters, string inverters with DC power optimizers and microinverters. Why is a solar inverter so dangerous? Because the inverter is the brain of your solar system, and it's also, historically, the device that has the highest probability of failure, which can leave you in the dark (literally and figuratively). A solar inverter's main function is to switch DC power created by solar panels into AC power that's usable for your home appliances.
